Your Brain Matters

ACHIEVING PEAK MILITARY PERFORMANCE

SMARTfit's advanced cognitive-motor dual-task (CMDT) technology is designed to put warfighters "in the zone", that state of supreme focus with heightened awareness where time slows down, they are totally immersed in the present, the brain fully connects with the body, and peak performance is achieved.

Improved Cognitive Performance

Dual-task training has been shown to enhance working memory and attentional control in military personnel.

Enhanced Motor Skills

Performing cognitive tasks simultaneously with physical movements can lead to improvements in tactical-specific motor skills.

Transferable to Real-World Tasks

The cognitive-motor integration developed through dual-task training can translate to better performance in complex, real-world military operations.

Rapid Movements in Response to a Stimulus

Reactive agility training involves quickly changing movements based on unpredictable cues, requiring both visual and cognitive processing.

Incorporates Visual and Cognitive Elements

Reactive agility training includes components that challenge a tactical athlete's perceptual-cognitive skills, such as decision-making and

BACKED BY SCIENCE

SMARTfit's advanced cognitive-motor dual-task technology uniquely trains the brain both top-down and bottom up to perform both simple and complex cognitive tasks at peak levels while the body is in motion.

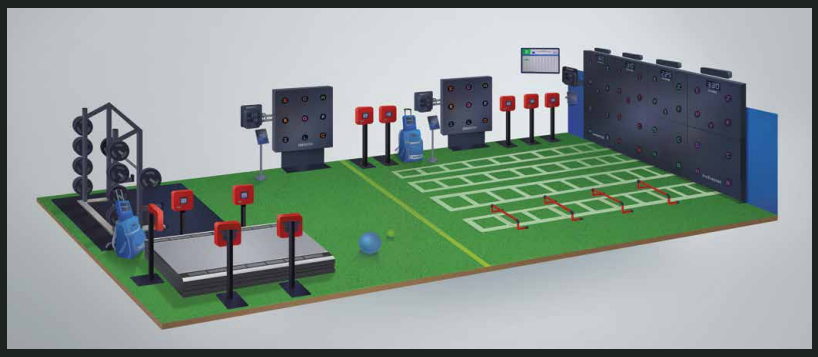

Not just to react faster, but to think quickly and clearly before reacting, so warfighters and support personnel make faster and better decisions while physically and mentally stressed and exhausted.

This customizable approach, with variable high cognitive and physical demands combined with tactical movements, mimics real-world scenarios and provides a more ecologically valid training environment compared to traditional agility training.
